Facade and structure cleaning without access equipment.

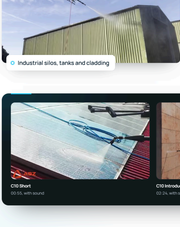

Drone cleaning removes the requirement for scaffolding, cradles, powered access or rope teams across a substantial proportion of facade, glazing, cladding and roof maintenance. The work is carried out from ground level, and setup is measured in minutes rather than days.

It does not replace access equipment for every application. We identify where it does not before specifying a system.

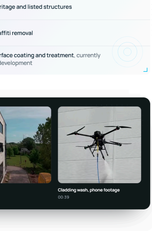

Book a demonstration

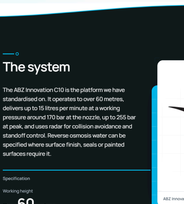

Applications

Commercial and residential facades, and glass curtain walling

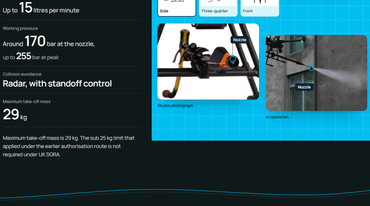

Solar farms and rooftop arrays

Industrial silos, tanks and cladding

- Wind turbine towers
- Heritage and listed structures
- Graffiti removal
- Surface coating and treatment, currently in development

The system

The ABZ Innovation C10 is the platform we have standardised on. It operates to over 60 metres, delivers up to 15 litres per minute at a working pressure around 170 bar at the nozzle, up to 255 bar at peak, and uses radar for collision avoidance and standoff control. Reverse osmosis water can be specified where surface finish, seals or painted surfaces require it.

Specification

Working height
Over **60** metres

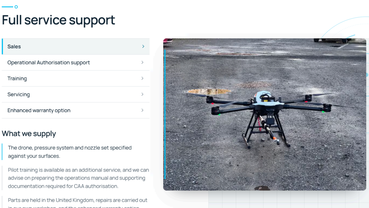

Flow rate
Up to **15** litres per minute

Working pressure
Around **170** bar at the nozzle, up to **255** bar at peak

Collision avoidance
Radar, with standoff control

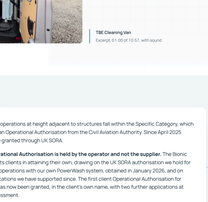

Maximum take-off mass
29 kg

Maximum take-off mass is 29 kg. The sub 25 kg limit that applied under the earlier exemption route is not required under UK SORA.

Full service support

- Sales
- Operational Authorisation support
- Training
- Servicing
- Enhanced warranty option

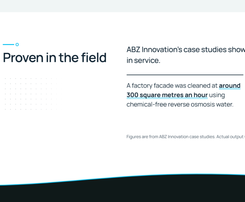

What we supply

The drone, pressure system and nozzle set specified against your surfaces

Pilot training is available as an additional service, and we can advise on preparing the operations manual and supporting documentation required for CAA authorisation.

Parts are held in the United Kingdom, repairs are carried out in our own workshop, and the enhanced warranty option provides priority servicing and maintenance, with loan equipment where parts are unavailable. We also offer white label services, arranged in advance, giving clients additional capacity.

Operating legally

Cleaning operations at height adjacent to structures fall within the Specific Category, which requires an Operational Authorisation from the Civil Aviation Authority. Since April 2025 these are granted through UK SORA.

The Operational Authorisation is held by the operator and not the supplier. The Bionic Eye assists clients in attaining their own, drawing on the UK SORA authorisation we hold for cleaning operations with our own PowerWash system, obtained in January 2026, and on the applications we have supported since. The first client Operational Authorisation for the C10 has now been granted, in the client's own name, with two further applications at final assessment.

How authorisation works →

Proven in the field

ABZ Innovation's case studies show what the C10 delivers in service.

A factory facade was cleaned at **around 300 square metres an hour** using chemical-free reverse osmosis water.

A roof carrying ten years of moss, **about 550 square metres**, was cleaned in **roughly three hours** with no chemicals, and the system was set up and ready to fly in **fifteen minutes**.

Figures are from ABZ Innovation case studies. Actual output varies with the surface, the level of soiling and site conditions.

Enquiry

Send us the sites you intend to work on. We will identify which are straightforward under a standard authorisation, which require additional work, and which are unlikely to be viable, before any commitment is made.
